HTTPS Conversion Tool

The latest versions of Moodle include a HTTPS conversion which helps you search for and change over any external links in the database to https.

To access it:

Site administration > Security > HTTP Security

At the bottom you should see a link to the HTTPS conversion tool if you are on a recent version of Moodle.

The direct link is: `/admin/tool/httpsreplace/index.php`

It will first run scan over the database and then advise of any URLs that require changing from http to https and allow you to perform an update.

Very handy especially if you are getting reports of mixed content warnings from the browser.
