Language Pack Cache

You can purge the language pack cache through the Cache Administration page. Simply find the `Language string cache` definition and then select purge.

Language string cache	Application	core	string	Default file store for application caches	Site identifier	Edit mappings, Edit sharing, Purge

This is very handy if you make any language customisations as these are cached and require a cache purge to see.

Also, if your language customisations aren't taking efect:

- Language pack strings are usually single (`'`) quoted. So if you use one of these in your customised text, it will actually throw an error but not necessarily tell you. Use double quotes (`"`) or if possible nothing at all.
- Check for any strange characters in your customisation text e.g. don't use a rich editor like Microsoft Word, make sure you are pasting *plain* text.
