

Showing additional fields on user profile page

The fields displayed on the user profile page (public profile) are controlled by the code in `lib/myprofilelib.php`. You'll find there is logic in there that checks for certain configuration settings.

For example, if you wanted to show the phone number (`phone1`), mobile phone (`phone2`) and id number fields (`idnumber`), there is a setting under the function `core_myprofile_navigation` that determines which contact details to show using the data in the configuration variable `$CFG->showuseridentity`.

This can be set in the site administration area under:

Site administration > Users > Permissions > User Policies

You could also set the value of this in config file as `$CFG->showuseridentity` as a string of comma separate values e.g.

```
$CFG->showuseridentity = 'phone1,phone2,idnumber';
```

Sometimes these settings are hard to find the Site administration user interface, until you have a look in the code and then search for the relevant configuration item like `showuseridentity`.
