Disable Plugin Installation

A really simple way to disable the installation of a single plugin is to set the value:

```
$plugin->version = 0;
```

In the plugin's `version.php` file. For example the plugin might be failing etc.

If you want to disable plugin installations from within the site via the navigation:

Site administration > Plugins > Install plugins

Set the following flag in `config.php`. This might be a good idea if you have non-technical users with Site administration access, otherwise there could be trouble!

```
$CFG->disableupdateautodeploy = true;
```

Remember to clear your cache for this setting to take effect.
